

Comparing Two Classrooms in One School

These are particle count readings in two identical classrooms across the hall from each other, each with 28 students and a teacher. The yellow is the particles per cubic foot outside that day, the blue is a classroom without a Purifan, and the maroon color is the particle levels of a Purifan equipped classroom. Breathing Cleaner Air has many positive health benefits and can reduce health costs for students and teachers. Respiratory illness is the number one cause of missed school days, causing over 15 million days in 2004. Asthma rates in children increased 164% in last 10 years, and outdoor air quality improved. Children create these particles, and bring these particles into any classroom, new or old. If you have 28 children in a classroom you will have about 4 with Asthma, 22 with cats at home, 15 with multiple cats and 18 with dogs! An allergic child has no chance of staying healthy in a typical classroom without a Purifan Clean Air System installed.
